TITLE: Extraction of hydriodic acid from aqueous solutions and separation of zinc and cadmium iodide complexes.

SOURCE: Ukrainskiy khimicheskii zhurnal, v. 30, no. 3, 1964, 274-279

TOPIC TAGS: hydriodic acid, zinc iodide complex, cadmium iodide complex, extraction, zinc cadmium separation, selective extraction, extractant, partition coefficient, rhodanide precipitation, solvent dielectric constant

ABSTRACT: Elements occurring in the same series are separated in the form of their halide and rhodanide complexes by selective extraction. In this study the distribution of hydriodic acid and of zinc and cadmium iodide complexes between water and oxygen-containing organic solvents was determined. By increasing the initial concentration of HI from 0.1 to 5.0 moles/l. its transfer to the organic phase of the water-organic solvent system is increased. The ability to extract HI increases in the following series of solvents: isoamylacetate, diethyl ether, isoamyl alcohol, butanol (best extractant). The extracting ability of these alcohols

Card 1/3

ACCESSION NR: AP4022109

parallels their dielectric constant. The distribution of zinc and cadmium iodide complexes (prepared from aqueous solutions of the corresponding sulfates and KI) between aqueous H_2SO_4 -KI solutions and the following solvents was studied: isobutyl alcohol, isoamyl alcohol, diethyl ether, isobutylacetate, methylbutyl ketone, isoamyl acetate, and isoamylbenzoate. Increasing the acidity of the medium increases the separation of Cd into the organic phase, e.g., in isoamyl alcohol the partition coefficient is increased from 1.42 in 0.05 M H_2SO_4 to 111.00 in 6 M acid. An analogous effect occurs with Zn, only to a much lesser degree, on extraction with isoamyl alcohol, diethyl ether and methyl butylketone (from 0.12 in 0.05 M acid to 0.33 in 6 M acid in isoamyl alcohol). Extraction of the zinc iodide with the remaining organic solvents starts to increase with solutions 3 M or higher in acid. The ability of the alcohols and of the complex ethers to extract cadmium iodide increases with an increase in the molecular weight of a given class of compounds. By extracting a Cd-Zn mixture with isoamyl alcohol and subsequently treating the extract with a 25% solution of ammonium rhodanide, Zn-free Cd can be obtained even with an initial Zn:Cd ratio of 10:1. Orig. art. has: 4 tables.

 TITLE: Crane with variable extension boom. Class 35, No. 176667
 SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 23, 1965, 43
 TOPIC TAGS: crane, loading machinery, transport equipment
 ABSTRACT: This Author Certificate presents a crane with variable extension boom which has a pinned supporting strut. The end of the strut is connected through a compound pulley system to the crane boom. To increase the lifting capacity with extended boom by eliminating compressive loads and to decrease crane height during transport, the pinned supporting strut is mounted at the base of the boom and is equipped with a diverting pulley mounted on the bottom part of this pulley so that the pulley forces are directed upward, opposing the forces resulting in the strut due to tension in the boom pulley system (see Fig. 1).

TOPIC TAGS: rectifier, electrolytic, sulfuric acid, boric acid, cadmium carbonate electrode

TRANSLATION: Electrolytic rectifiers based on TiO₂ in aqueous solutions of H₂SO₄ and HBO were investigated. The rectification coefficient (RC) reaches several hundred thousand and depends on the amplitude of the applied alternating voltage, the composition of the

Card 1/2

L 16858-63

ACCESSION NR: AR3C06316

electrolyte, and the conditions of forming the oxide layer. The RC has high values at low frequencies and decreases sharply at 1.5 kcs; the maximum frequency at which detection was observed is ~ 10 Mc. Application of a small DC voltage to the electrolytic cell improves the rectifier characteristics. The electrolytic rectifier with oxidized Cd electrode in a solution of K_2CO_3 has a small RC (30--40).

TITLE: Resonant acoustoelectric effect during a-c transmission through selenium rectifiers

SOURCE: Ref. zh. Fizika, Abs. 8E544

REF SOURCE: Uch. zap. Azerb. un-t. Ser. fiz.-matem. n., no. 4, 1965, 53-55

TOPIC TAGS: acoustoelectric effect, selenium rectifier, pn junction, resonant acoustoelectric effect, ac selenium rectifier, oscillation frequency, frequency multiplication

ABSTRACT: It has been experimentally established that Se-rectifiers are electroacoustic oscillators radiating intense directed sound at specific resonant frequencies which are multiples of the fundamental a-c frequency. The constant shift, which acts in the opposite direction and does not exceed a given limit, amplifies the sound as it is transmitted through the a-c rectifier. These methods make it possible to record both strong and weak sonic oscillations. The observed effect can be used for multiplying the electric oscillation frequency. The quality

Card 1/2

ORG: Institute of Cybernetics, AN UkrSSR (Institut kibernetiki AN UkrSSR)

TITLE: Effect of technological parameters on the magnetic properties of permalloy films obtained by condensation of the vapor of an alloy in vacuum

SOURCE: AN UkrSSR. Fizika metallicheskih plenok (Physics of metal films). Kiev, Naukova dumka, 1965, 84-90

TOPIC TAGS: magnetic thin film, permalloy, magnetic property, crystallization, phase transition, temperature dependence, magnetic domain boundary, magnetic coercive force, magnetic anisotropy

ABSTRACT: The purpose of the investigation was to determine the optimal condensation conditions under which the uncontrolled substrate heating and heat release of the vapor-crystal phase transition are reduced to a minimum. The tests were made with a specially developed evaporator and the substrate temperature was measured with a Cu-Ni thermocouple in the form of a film deposited directly on the substrate. Measurements were made of the substrate heat rise and phase transition heat release against the time, of the coercive force and the displacement of the domain boundaries against the film thickness, and of the relative change in the coercive force as a function of the uniaxial anisotropy of the films. The test consisted of checking the influence of different condensation parameters on the magnetic properties of the

Card 1/2

L 46707-66

ACC NR: AT6020706

films. The results show that the substrate temperature is noticeably increased by the thermal radiation of the evaporator and by the heat released in the phase transition. This temperature rise can be reduced by increasing the condensation rate or by using an evaporator with smaller heating area. Comparison of data obtained for different condensation rates, residual gas pressures, and substrate temperatures shows that the magnetic properties are most influenced by the substrate temperature. With increasing temperature, the coercive force of films of thickness 300 - 900 Å increases, and since this is the thickness range in which the anisotropy energy constitutes a major fraction of the domain-boundary energy, it is concluded that at least one of the causes of this increase is the inhomogeneity of the uniaxial-anisotropy field. Title : On the Study of the Immunological Reactivity
of the Organism in Antitularemia Vaccination of
Subjects With Various Conditions of the CNS.

Orig Pub: Zh. microbiol., epidemiol. i immunobiologii,
1957, No 9, 46-51.

Abstract: The immunological reactivity (IR) to antitular-
emia vaccination was investigated in mentally ill
patients. The indices of IR were lower in schi-
zophrenic patients than in normal ones. IR did
not decrease in benign schizophrenia, oligophre-
nia and in some cases of parkinsonism.

TITLE : Acclimatization of Decorative Arboreal and Shrubby Plants in the Botanical Garden of Odessa State University.

ORIG. PUB. : Nauchn. yezhegodnik Odessk. un-t, 1956, Odessa, 1957, 226-228

ABSTRACT : The work was conducted during 1950-1956. A study was made of the development rhythm, growth dynamics, winter hardiness, and degree of acclimatization of 143 arboreal-shrubby species and decorative garden varieties. Acclimatization was most successful in the case of North American and European species, and also of plants of Northwestern Asia, Central and Western China. Plants from the Himalayas, Mediterranean countries, subtropical areas of China and Japan, undergo considerable damage. Under the conditions of Odessa area, a favorable outlook of acclimatization has been ascertained for cedar, magnolia, Lankoran albizzia, pterocarya, agnus castus, buddleia, etc. A study was made of the procedures of propagation of ginkgo,

ABSTRACT

The calculations carried out by the author show that with equal number of windings, equal frame cross section, equal carrier wires and equal magnetic field in the air gap, the sensitivity of a galvanometer with a round frame is 29% higher than for one with a right angle frame. In order to preserve the radial magnetic field in the case of a round frame, the magnetic pole pieces are constructed with spherical deepenings and the core is cone shaped. The equation for the increase of sensitivity is derived for both cases and the proof produced for the above mentioned 27% higher sensitivity in a galvanometer with a round frame. The purely qualitative explanation of this manifestation consists of the fact that with a round frame the magnetic field with all elements, but with a right angle one, interacts; it interacts only with those windings which are situated in the two side frame. Finally it is ascertained that with the same logarithms the round frame weighs less than the right angle.

TITLE: Magnetic properties of thin ferromagnetic films and the performance curves of film elements of memory matrices 160

SOURCE: AN UkrSSR. Kiberneticheskaya tekhnika (Cybernetic techniques). Kiev, Naukova dumka, 1965, 11-18

TOPIC TAGS: magnetic thin film, ferromagnetic film, thin film memory, thin film circuit

ABSTRACT: The development of magnetic film memories is impossible without investigations of the relationship of the performance curves of matrices to the magnetic properties of the elements and investigations of the patterns of variations in the geometric and technological parameters of the films. The direct aim of these investigations is the determination of the optimal magnetic properties of the films and the dependence of their parameters. The present article investigates the dependence of the threshold characteristics of magnetic film elements of matrices on the coercive force of the shift of domain boundaries H_c , the uniaxial anisotropy field H_k , and on the dispersion of the mean directions of
